

Interface for creating PDF bookmarks in the indexing script

There is a new interface in the indexing script that allows generation of a bookmarks tree in the output PDF file based on the document contents. For example, you can make the script go through the text of the document, find particular words or phrases and create bookmarks linking to those phrases in the output PDF file. The interface is described below.

IToAttributeDocument object in the indexing script has *Bookmarks* property that returns *IBookmarkItems* interface:

IBookmarkItems interface

- Count
- Item //returns *IBookmarkItem* interface
- AddLast(pageIndex, hPosition, vPosition)

IBookmarkItem interface

- Text (RW)
- HorizontalPosition (readonly)
- VerticalPosition (readonly)
- PageIndex (readonly)
- Children // *IBookmarkItemsInterface*
